## FUNCTIONAL DESCRIPTION

### ***Bus Interface***

Data are transmitted to and from the microprocessor to the PT2258 via the SDA and SCL. The SDA and SCL make up the BUS Interface. It should be noted that the pull-up resistors must be connected to the positive supply voltage.

### ***Data Validity***

A data on the SDA Line is considered valid and stable only when the SCL Signal is in HIGH State. The HIGH and LOW States of the SDA Line can only change when the SCL signal is LOW. Please refer to the figure below.

### ***Start and Stop Conditions***

A Start Condition is activated when 1) the SCL is set to HIGH and 2) SDA shifts from HIGH to LOW State. The Stop Condition is activated when 1) SCL is set to HIGH and 2) SDA shifts from LOW to HIGH State. Please refer to the timing diagram below.

### **Byte Format**

Every byte transmitted to the SDA Line consists of 8 bits. Each byte must be followed by an Acknowledge Bit. The MSB is transmitted first.

### **Acknowledge**

During the Acknowledge Clock Pulse, the master ( $\mu$ P) puts a resistive HIGH level on the SDA Line. The peripheral (audio processor) that acknowledges has to pull-down (LOW) the SDA line during the Acknowledge Clock Pulse so that the SDA Line is in a Stable Low State during this Clock Pulse. Please refer to the diagram below.

The audio processor that has been addressed has to generate an Acknowledge after receiving each byte, otherwise, the SDA Line will remain at the High Level during the ninth (9th) Clock Pulse. In this case, the master transmitter can generate the STOP Information in order to abort the transfer.

### **Transmission without Acknowledge**

If you want to avoid the acknowledge detection of the audio processor, a simpler  $\mu$ P transmission may be used. Wait one clock and do not check the slave acknowledge of this same clock then send the new data. If you use this approach, there are greater chances of faulty operation as well as decrease in noise immunity.

**Interface Protocol**

The interface protocol consists of the following:

- A Start Condition
- A Chip Address Byte including the PT2258 address. The 8<sup>th</sup> Bit of the Byte must be “0”. PT2258 must always acknowledge the end of each transmitted byte.
- A Data Sequence (N-Bytes + Acknowledge)
- A Stop Condition

Please refer to the diagram below:

Note: ACK = ACKNOWLEDGE  
 MAX. CLOCK SPEED = 100KBITS/S

**Software Specification**
